Personal Contribution

Data quality assurance, exploratory visualization, and statistical modeling validation. Conducted missing value analysis across 34,121 observations; implemented outlier detection (IQR method); verified 273 REIT identifiers; resolved duplicates. **16.5 hours.**

Defended Decision: Conservative Outlier Winsorization (± 5 SD)

Evidence: Preserves 99.98% of data. ± 3 SD would exclude 58 valid observations, introducing downward bias in leverage variance. Beta coefficient remains stable (0.0060–0.0062 across winsorization levels); leverage coefficients unchanged.

Key Limitation

Survivorship Bias: Sample excludes bankrupted/merged REITs. Results biased upward among successful firms; should not be extrapolated to predict distress.
