

Individual Addendum: Olivia Williamson

Team: ILOVECODING | Role: Econometric Design & Estimation Lead | Date: May 1, 2026

Personal Contribution

Econometric specification, model estimation, and interpretation. Architected two-way FE and DiD; implemented entity-level clustering; conducted diagnostics; led final synthesis.
17 hours.

Defended Decision: Entity-Level Clustering (vs. Driscoll-Kraay)

Evidence: Entity-level targets REIT-specific shocks (leverage decisions, management); more appropriate than Driscoll-Kraay which treats time as primary. Produces $SE(\beta) = 0.0014$; Driscoll-Kraay would inflate artificially.

Key Limitation

Regime Shifts (2000–2024): Sample includes 2008 crisis and 2020 pandemic. Different regimes may have different leverage-return relationships; results not fully representative of normal times.
